Write Up

The proposition that I am trying to persuade on both sides is California's Reproductive FACT Act of 2015. The first two graphs are in support of the FACT Act of 2015, where the stance is that the act helped make abortion more accessible in California, especially when compared to all the other states in the US. In the second set of graphs, the stance is that this same act did not make abortion more accessible in California, nor did it increase the number of abortion providers in California and rather caused it to decrease instead.

I am leaning towards the first two visualizations because the highlighted bar for California easily draws the audience in and makes them focus directly on what I intended them to. Additionally, the bars are ordered in decreasing and increasing order of percentage of US abortions per state and percentage of abortion patients per state respectively, which makes it easy to understand where California lies and how crucial the statistics are in relation to other states because in both graphs, California is located on the extreme end of the spectrum, heavily indicating that abortion became more successful such that in 2020, California itself contained 16.6% of all US abortions and that 0% of people left California to get an abortion, meaning that there were sufficient resources in California.

The latter 2 charts are opposing the FACT Act of 2015 and shows that the percent change in abortion rate in California wasn't that drastic compared to other states (2017-2020) and that there was a huge decrease in abortion providers in California specifically from 2014-2017. In the abortion providers graph, this was deceptive due to the nature of the data in the dataset specifically. If we look closely, 114 California hospitals that reported providing 633 abortions in 2014 reported zero procedures in 2017 Guttmacher Institute. It was most likely due to this dramatic change in hospital reporting that contributed to the apparent decline in abortion providers. Additionally, many facilities that were counted as independent abortion providers in 2014 were reclassified or consolidated in the 2017 data. This did not mean services disappeared but rather changed how they were counted in the statistics. In the chart that demonstrated the percentage change in abortion rate from 2017-2020, we didn't see the dramatic difference we were expecting to see due to the timeline that this visualization focused on. As the FACT Act was implemented in 2015, this visualization didn't effectively show data from before and after the implementation of the proposition, as this period was after the FACT Act being implemented, which is deceptive in showing the actual effects that was caused by this act.
